CTDI Releases New GoDigital Telecom Product

West Chester, PA & Fremont, CA, (September 15, 2006) Communications Test Design, Inc. (CTDI), the largest independent global telecommunications repair and logistics provider, announced today that its GoDigital Products Group (www.godigital.com) has released the XCel-12GS, a 12-line digital loop carrier targeted to the independent telecom market.

The XCel-12GS will convert a single conventional telephone line into 12 high-quality, fully-featured lines, providing an alternative to additional copper or fiber optic cable runs. Up to twelve lines can be installed at a single location or distributed along any given route, providing a reach of 50,000 feet or more. Now, with CTDI's GoDigital XCel-12GS and XCel-4a products, carriers can install twelve voice lines and four DSL lines at any remote location using only two copper pairs. This allows carriers to provide their customers with the voice and data services they demand no matter how remote their customer may be located.

"In today's competitive telecom environment, telephone companies are continually challenged to offer customers expanded, high-bandwidth services, such as ADSL," states Brian Parsons, Director of CTDI's Products Division. "With the continued growth of home businesses and telecommuting, many customers requiring those expanded services live in remote locations where existing copper cables may not have enough capacity, or where providing optical fiber may be difficult in terms of cost, logistics and installation. CTDI is helping to meet those challenges by providing a solution in a compact, cost-effective package via our new XCel-12GS as well as our existing XCel-4a DSL extension system."

GoDigital is the leading supplier of line-powered broadband network access products in North America, and was acquired by CTDI earlier this year. More than 300 local exchange carriers use GoDigital products, including Qwest, Verizon, ALLTEL, CenturyTel, TELUS and Iowa Telecom.
